DOI: Perkolasi didefinisikan sebagai proses masuk atau menembusnya air pada lapisan permukaan tanah secara gravitasi hingga mencapai lapisan tanah yang dalam keadaan jenuh air. Tes perkolasi ini dimaksudkan untuk menentukan seberapa besar luas area meresapnya air untuk jenis tanah tertentu. Salah satu fungsi dilaksanakannya Uji Perkolasi ini adalah untuk menentukan panjang pipa resapan pada septick tank, agar air dapat terserap oleh tanah disekitarnya dan tidak akan mempengaruhi muka air tanah. Untuk itu peneliti melakukan penelitian Uji Perkolasi di Kampus Politeknik Negeri Manado khususnya di kompleks perkuliahan untuk menentukan panjang pipa resapan pada septick tank yang ada. Penelitian yang diusulkan ini diharapkan menjadi salah satu solusi terbaik dalam menata masalah panjang pipa resapan yang ada di kampus Politeknik Negeri Manado. Nilai penting dari penelitian ini adalah: Menghasilkan analisis yang akurat mengenai nilai perkolasi di kompleks perkuliahan Politeknik Negeri Manado, Menghasilkan analisis yang akurat mengenai dimensi septick tank yang ideal di kompleks perkuliahan Politeknik Negeri Manado, Dari hasil penelitian, didapat bahwa rata-rata laju perkolasi adalah 22 menit, daya resap tanah adalah 877 L/m<sup>2</sup>/hari, panjang bidang resapan adalah 2,7 m. Merujuk hasi yang diperoleh, maka perlu ditinjau kembali dimensi dari semua tangki septik yang ada dan membuat sistem peresapan yang terpisah sesuai SNI 2398:2017. Metrics visibility 122 views get\_app 70 downloads TH's paper is to 1tudy the effect of organicsolvents and percolation time on oleoresinproperties of COILBia veru bark. The organic solvents used during the percolation process to extract the oleoreain consist of ethanol and acetone. Each extraction required percolation time, consecutively 2, 3, and 4 hou'rh. The temperature of each procea was mlintained at 40° C. The experiment was conducted utling the factorial design, and the trend effect. of percolation time was 011Bea sed by using polynomial orthogonal analysis.The • results indicated that the eaential oil and cinnamaldehyde contents extracted with ethanol solvent were both significantly higher than those using acetone solvent. The polynomial orthogonal analysis revealed that the incieasing percolation time was linearly correlated with an increase in oleoresin yield and the essential oil contents. As for the ethanol the increaein percolation time tent to decrease the cinnamaldehyde only. After the percolation proceBB only the ethanol after solvent could be recovered by the redistillation proese: • Abbah, J., Amos, S., Chindo, B., Ngazal, I., Vongtau, H. O., Adzu, B., Farida, T., ...
